## For Continuous Data

1. Central Tendency
2. Variability or Dispersion
3. Skewness
4. Kurtosis

## Central Tendency

Common central tendency measures: mean, median, mode (the most frequent value)

### Mean

Sample Mean:

$$\bar{x} = \frac{\sum x_i}{n}$$

Population Mean:

$$\mu = \frac{\sum X_i}{N}$$

### Median

Sample Median:  $\tilde{x}$

Population Median:  $\eta$  (eta)

## Dispersion or Variability

4 common measures of dispersion:

1. Range:  $R = \max - \min$
2. Variance: population  $\sigma^2 = \frac{\sum (X_i - \mu)^2}{N}$ , sample  $s^2 = \frac{\sum (x_i - \bar{x})^2}{n-1} = \frac{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}{n-1}$
3. Standard Deviation: population  $\sigma = \sqrt{\sigma^2}$ , sample  $s = \sqrt{s^2}$

4. Coefficient of Variation (CV): population  $CV = \frac{\sigma}{\mu} \times 100\%$ , sample  $CV = \frac{s}{\bar{x}} \times 100\%$   
(no unit)

**Remark.** *Why use  $n - 1$ ? because it is proved to be more accurate.*

Disadvantages of Range: sensitive to outliers

Variance represents the distance from the mean

Variance and Standard Deviation are absolute measures of dispersion (about mean), while Coefficient of Variation is a relative measure of dispersion (about mean).

## Skewness

Aka. shape of the distribution

3 types of skewness:

1. Symmetrical: mean = median = mode
2. Right Skewness or Positive Skewness: mean  $\gg$  median
3. Left Skewness or Negative Skewness: mean  $\ll$  median

Skewness Coefficient ( $g_1$ ):  $g_1 = \frac{\frac{\sum(X_i - \bar{x})^3}{n-1}}{s^3}$

1.  $g_1 = 0$ : symmetrical
2.  $g_1 > 0$ : right skewness
3.  $g_1 < 0$ : left skewness

## Kurtosis

$$g_2 = \frac{\frac{\sum(x_i - \bar{x})^4}{n-1}}{s^4} - 3$$

1.  $g_2 = 0$ : meso-kurtic
2.  $g_2 > 0$ : leptokurtic (more peaked)
3.  $g_2 < 0$ : platykurtic (less peaked)

## Measures of Non-central Tendency

1. Quartiles:  $Q_1, Q_2, Q_3$
2. Percentiles:  $P_1, P_2, \dots, P_{99}$ : E.g.  $P_{20} \Rightarrow 20\%$  data  $\leq P_{20}$
3. Interquartile Range (IQR):  $Q_3 - Q_1$

### How to find Quartiles

1. Arrange data in **ascending order**
2. Cal  $Q_1 = 0.25 * (n + 1)$ ;  $Q_3 = 0.75 * (n + 1)$ ;

3. If  $Q_1$  or  $Q_3$  is not an integer, take the average of the two values around it.
